Animal Pharm writes about strangles and Strangvac®

The recognized journal Animal Pharm once again highlights Strangvac® in an article about the research now approaching a solution regarding effective vaccine protection against strangles.

The article points out that, despite over 100 years of research the disease remains the most frequently diagnosed infection of horses worldwide. In the UK alone more than 20,000 horses are infected annually by Streptococcus equi, the bacteria responsible for the development of strangles.

The online abstract can be found here.

Animal Pharm is a recognized international news journal, based in London, reporting on the latest events in the animal health field. The journal is spread globally, reaching many key players in the Animal Health field.
